

L8: Lesson Summary

This lesson introduced you to several important topics about community detection:

- Overlapping communities
- Dynamic communities
- Synthetically generated communities
- Evaluating community detection algorithms using the Normalized Mutual Information (NMI) metric
- The notion of connector hubs and provincial hubs in the community structure of a network
- An application of overlapping community detection from spatio-temporal data in the context of climate science

The area of community detection is still an active research topic, especially in the context of dynamic or temporal networks, multi-layer networks, and inter-dependent networks.

It also has many applications in a wide spectrum of disciplines, making it an excellent topic for applied research projects.
