

Lesson One Summary

Text

We have reached the end of this first lesson. We have covered a large number of topics for many different disciplines. Please do not be discouraged, if you have not fully understood the parts that relate to biology, neuroscience or other disciplines. My main goal was to give you example of systems that can be modeled and studied using the network abstraction. For the remainder of this course, we will be mostly dealing with algorithms, data and metrics, concepts that are quite familiar to graduate students in computer science. If you are intrigued about any of the systems we mentioned today, I strongly suggest you read research papers that are linked on the overview page as recommended reading. I will leave you with a high level talk by Albert Laszlo Barabasi, who is widely considered as the father of Network science. He is a charismatic speaker and I'm sure you will enjoy his TED talk about the important role of networks in biology.
