

L2: Min-Cut Problem

Another important concept in graph theory (*and network science*) is the notion of a **minimum cut** (or *min-cut*). Given a graph with a source node s and a sink node t , we define as **cut(s,t)** of the graph a set of edges that, if removed, will disrupt all paths from s to t .

In unweighted networks, the min-cut problem refers to computing the cut with the minimum number of edges. In weighted networks, the min-cut refers to the cut with minimum sum of edge weights.
