

L2: Lesson Summary

The objective of this lesson was to review a number of important concepts and results from graph theory and graph algorithms.

We will use this material in subsequent lessons. For example, the notion of random walks will be important in the definition of the PageRank centrality metric, while the spectral properties of an adjacency matrix will be important in the eigenvector centrality metric.

The Module-1 assignment will also help you understand these concepts more deeply, and to learn how to apply them in practice with real-world network datasets.
